

School of Computer Science and Information Technology E-Learning Platform

Student: Malual Majur Dhaal & Benis Garang Wantok | **Supervisor:** Mr. Samuel Dut Deng

Problem & Motivation

- **Problem Context:** Reliance on traditional face-to-face instruction in resource-constrained environments creates severe space, interaction, and feedback limitations that hinder effective computer science and IT education for large student cohorts.
- **Research Gap:** There is a an e-learning platform tailored to the School of Computer Science And Information Technology.
- **Objective:** Implement an e-learning platform for the School of Computer Science and Information Technology (SCSIT) in order to raise learning efficiency and improve learning relationship between students and lecturers..

Conceptual Framework

The conceptual framework for this study integrates TAM and Constructivist Learning Theory to show how system design, user perceptions, and institutional support interact to affect learning outcomes and platform sustainability.

Results

Following are screenshots of our fully implemented system.
